Education

- B.Sc. in Computer Science, University of British Columbia Sept. 2020 – May 2024
- With Distinction; Dean's Honour List 2020

Experience

Software Developer, OlaTech Corporation – Remote (Canada) May 2024 – Current

- Built a Java-based backend export system for deeply nested data objects, enabling reliable cross-environment data migration and interoperability.
- Developed and tested REST APIs for mobile authentication, messaging, user workflows, and online store catalog and cart operations using Java, Spring Boot, and MVC architecture; integrated with legacy JSP-based inventory and payment systems and documented endpoints with Swagger/OpenAPI.
- Implemented reporting dashboards and Kafka-based event/data pipelines integrating external systems for real-time and batch data processing; wrote and optimized SQL queries to power client report views and improve data-fetching performance.
- Supported production backend systems by maintaining Linux/Unix servers, managing AWS EBS storage expansion, and operating Jenkins CI/CD deployment pipelines to ensure stable releases.
- Collaborated with enterprise clients to configure backend-driven workflows and HTML/CSS/JavaScript-based operational data views based on business requirements.

Teaching Assistant, University of British Columbia

May 2023 – Jun. 2023

- Guided students through applied machine learning assignments using Python, scikit-learn, NumPy, pandas, and Matplotlib, helping them reason through open-ended modeling and data analysis problems.
- Collaborated with course staff to assess assignments, invigilate exams, and maintain consistent grading standards across a large cohort.
- Supported course delivery by answering questions on discussion forums, identifying recurring pain points, and refining explanations based on student feedback.

Projects

AgentAway

May 2026

- Reduced manual code review overhead for engineering teams by building a full stack developer platform with FastAPI, Next.js, and PostgreSQL that automates coding-agent workflows across linked repositories.
- Protected proprietary source code during AI automation adoption by implementing HMAC webhook verification, encrypted provider keys, scoped API tokens, and audit logging with PostgreSQL for repository access.
- Automated draft PR workflows using GitHub Apps, Celery, and Docker to isolate changes, run tests before merge, and reduce unvalidated production deployments.

Interval Timer App

Aug. 2024

- Implemented customizable interval settings to allow users to configure set, rep, rest durations, and alert preferences.
- Integrated concurrent timer and stopwatch that preserve progress across app sessions.
- Enabled seamless background sound integration, allowing alerts without disrupting background sounds.

NLP Sentiment Analysis Engine

Feb. 2023

- Implemented a Naive Bayes sentiment classification engine in Haskell, trained and validated on the IMDb dataset with configurable train-test splits, demonstrating the ability to evaluate model performance tradeoffs and select the right data strategy for a given accuracy/compute budget.
- Built an NLP text preprocessing pipeline and a model persistence layer that serializes trained parameters to disk and caches validation scores, eliminating redundant recomputation and reducing inference setup time for repeated use cases.
- Designed an interactive CLI for loading trained models, inspecting model state, and classifying new text inputs without modifying source code.

UBC Course & Room Explorer

Sept. 2022 – Dec. 2022

- Developed TypeScript application features for querying university course and room datasets, iterating on functionality based on peer and TA feedback.
- Designed automated tests with Mocha.js and Chai.js to validate complex query behaviour and edge cases, improving reliability for large and unbounded datasets.
- Collaborated in an Agile scrum environment using Git-based workflows, participating in sprint planning, code reviews, and iterative feature delivery.
- Implemented efficient JSON query-processing logic to support scalable filtering and retrieval of university course and room data

Formula 1 Database System

Jul. 2022 – Aug. 2022

- Built a robust transaction management layer using JDBC by disabling auto commit and implementing custom rollback logic to prevent partial data writes, ensuring complete database consistency and ACID compliance across related race, team, and driver records during transaction failures.
- Developed highly optimized Oracle SQL queries featuring relational division, nested subqueries, and natural joins to aggregate performance analytics and sponsorship data, enabling advanced business intelligence reporting for strategic decision making.
- Implemented a secure data access layer using parameterized prepared statements to safeguard against SQL injection attacks, leveraging dynamic result set metadata mapping to cleanly decouple database interactions from user interface components.
