

# Yegor Yeryomenko

Vancouver, BC | 236-509-2388 | yeryomenko.y@gmail.com | [LinkedIn](#) | [Portfolio](#)

## Education

- B.Sc. in Computer Science from UBC Vancouver Graduated May 2024  
With Distinction, Dean's Honour List 2020

## Experience

*Software Developer, OlaTech Corporation, Remote* May 2024 to Current

- Built a custom Java-based backend export feature to transfer complex, deeply nested data objects not previously supported, enabling reliable cross-environment data movement and system interoperability.
- Developed and tested REST APIs for mobile authentication, messaging, user workflows, and online store catalog and cart operations using Java, Spring Boot, and MVC architecture; integrated with legacy JSP-based inventory and payment systems and documented endpoints with Swagger/OpenAPI.
- Implemented reporting dashboards and Kafka-based event/data pipelines integrating external systems for real-time and batch data processing; wrote and optimized SQL queries to power client report views and improve data-fetching performance.
- Supported production backend systems by maintaining Linux/Unix servers, managing AWS EBS storage expansion, and operating Jenkins CI/CD deployment pipelines to ensure stable releases.
- Collaborated with enterprise clients to configure backend-driven workflows and HTML/CSS/JavaScript-based operational data views based on business requirements.

*Teaching Assistant, The University of British Columbia, BC* May 2023 to Jun. 2023

- Supported students during office hours by clarifying lecture material, troubleshooting Python code, and helping students develop structured approaches to exploratory machine learning problems.
- Collaborated with course staff to assess assignments, invigilate exams, and maintain consistent grading standards across a large student cohort.
- Supported course delivery by answering student questions on discussion forums, identifying recurring pain points, and adapting explanations based on student feedback.

## Projects

*AgentAway* May 2026

- Reduced manual code review overhead for engineering teams by building a full stack developer platform with FastAPI, Next.js, and PostgreSQL that automates coding-agent workflows across linked repositories.
- Protected proprietary source code during AI automation adoption by implementing HMAC webhook verification, encrypted provider keys, scoped API tokens, and audit logging with PostgreSQL for repository access.
- Prevented untested changes from reaching production by automating CI/CD-style draft PR creation with GitHub Apps, branch isolation, path validation, and test execution before merge using Celery and Docker.

### *Interval Timer App*

*Aug. 2024*

- Implemented customizable interval settings to allow users to configure set, rep, rest durations, and alert preferences.
- Integrated concurrent timer and stopwatch that preserve progress across app sessions.
- Enabled seamless background sound integration, allowing alerts without disrupting background sounds.

### *NLP Sentiment Analysis Engine*

*Feb. 2023*

- Implemented a Naive Bayes sentiment classification engine in Haskell, trained and validated on the IMDb dataset with configurable train-test splits, demonstrating the ability to evaluate model performance tradeoffs and select the right data strategy for a given accuracy/compute budget.
- Built an NLP text preprocessing pipeline and a model persistence layer that serializes trained parameters to disk and caches validation scores, eliminating redundant recomputation and reducing inference setup time for repeated use cases.
- Designed an interactive CLI for real-time inference, allowing non-technical stakeholders to load saved models, inspect model state, and classify new text inputs without touching source code, reducing the feedback loop between data scientists and end users during iterative model evaluation.

### *UBC Course & Room Explorer*

*Sept. 2022 to Dec. 2022*

- Built and iteratively refined TypeScript-based application features from evolving stakeholder requirements, incorporating peer and TA feedback to improve usability and maintainability.
- Designed automated tests with Mocha.js and Chai.js to validate complex query behaviour and edge cases, improving reliability for large and unbounded datasets.
- Collaborated in an Agile scrum environment using Git-based workflows, participating in sprint planning, code reviews, and iterative feature delivery.
- Implemented efficient JSON query-processing logic to support scalable filtering and retrieval of university course and room data

### *Formula 1 Database System*

*Jul. 2022 to Aug. 2022*

- Built a robust transaction management layer using JDBC by disabling auto commit and implementing custom rollback logic to prevent partial data writes, ensuring complete database consistency and ACID compliance across related race, team, and driver records during transaction failures.
- Developed highly optimized Oracle SQL queries featuring relational division, nested subqueries, and natural joins to aggregate performance analytics and sponsorship data, enabling advanced business intelligence reporting for strategic decision making.
- Implemented a secure data access layer using parameterized prepared statements to safeguard against SQL injection attacks, leveraging dynamic result set metadata mapping to cleanly decouple database interactions from user interface components.
